

Guidebook for proposers responding to the 3rd Announcement of Opportunity for Hayabusa2 samples

February 2023

Updated March 2023

The Astromaterials Science Research Group (ASRG) of JAXA will handle the 3rd Announcement of Opportunity (AO) with peer-review process in which Hayabusa2 sample investigation proposals will be selected. This guidebook is intended to help researchers who plan to submit proposals in response to the AO.

Key milestones for the Hayabusa2 3rd AO

- Call for proposals for the 3rd AO: February 14, 2023
- Notice of Intent to propose (mandatory): Due April 14, 2023
- Sample request submission: Due May 1, 2023
- Decision announcement: No later than early July, 2023
- Sample distribution: July, 2023
- Call for proposals for the 4th AO: July, 2023 (TBA)

1. Mission overview

1.1 *The Hayabusa2 mission and its scientific goal*

The Hayabusa2 spacecraft brought back surface samples of a near-Earth C-type asteroid (162173) Ryugu in December 2020. C-type asteroids have reflectance spectra that are similar to carbonaceous chondrites, and are therefore highly likely to record the long history of the solar system from the beginning to planet formation including the supply of volatiles to terrestrial planets. Hence, the main scientific goals of the Hayabusa2 mission are to carry out investigations of (I) the origin and evolution of the solar system and (II) the formation process(es) and structure of the asteroid. To fulfill the scientific objectives, a tight linkage between on-site geologic observations (kilometer to millimeter scale) and returned sample analyses (down to atomic scale) is crucial. The scientific instruments on board the spacecraft at the rendezvous were a laser altimeter (LIDAR), a multi-band telescopic camera (ONC-T), wide-angle cameras (ONC-W1 and -W2), a near-infrared spectrometer (NIRS3), a thermal infrared imager (TIR), a small carry-on impactor (SCI), a deployable camera (DCAM3), a sampler (SMP), and a lander (MASCOT).

1.2 *Overview of proximity operations at Ryugu*

Hayabusa2 explored Ryugu for seventeen months (June 2018–November 2019), and included two landing operations for sample collection. Ryugu (mean radius of 448 ± 2 m) has a retrograde rotation with a period of 7.6326 hours and an obliquity of 172° (Watanabe et al., 2019). It has a distinct spinning-top shape with an equatorial ridge (diamond-shaped lateral profile and circular as viewed top down). Its bulk density of 1.19 ± 0.03 g cm⁻³ suggests that Ryugu is a rubble-pile body with a large macro-porosity of ~50–60 % considering a typical density of carbonaceous chondrites. Many decameter-sized boulders, which are too large to be impact ejecta from craters found on Ryugu, are present at the surface with a number density twice as large as that of Itokawa, and no smooth terrain like Muses Sea on Itokawa is found (Sugita et al., 2019). The abundant large boulders on the surface also suggest that Ryugu is a rubble-pile body.

The surface has a very low geometric albedo (~0.02) (Sugita et al., 2019), darker than most of the meteorite samples in the terrestrial collection, and shows a weak but ubiquitous 2.72- μ m absorption feature related to O-H vibration in hydrous minerals (Kitazato et al., 2019). The absorption feature at 2.72- μ m is weaker than those of hydrated carbonaceous chondrites.

The in-situ observation of the Ryugu surface by the MASCOT lander showed that the surface is not covered with fine regolith particles (Jaumann et al., 2019) and that a ~3-cm pebble has a thermal inertia of ~ 280 J m⁻² K⁻¹ s^{-1/2}, which is much lower than chondritic meteorites (Grott et al., 2019). Thermal imaging of the surface also suggested low thermal inertia of surface boulders (Okada et al., 2020).

Hayabusa2 made its first landing operation on the equatorial ridge on February 22, 2019 to collect surface samples. The second landing operation was close to the artificial crater made by the small carry-on impactor (Arakawa et al., 2020) on 11 July 2019 to collect both surface samples and impact ejecta that contains sub-surface samples. A 5-gram tantalum projectile was shot through a 1-m long sampler horn at an impact velocity 300 ms⁻¹ at the contact time of each touchdown, triggered by bending and/or shrinkage of the sampler horn (Sawada et al., 2017). The firing of projectiles was confirmed for the two landing operations through the temperature rise near the projector due to firing. The ejecta is transferred into a sample catcher through an extendable sampler horn and a conical horn under a microgravity condition.

The sample catcher of Hayabusa2, located at the top end of the conical horn, has three chambers to store samples separately, as acquired at different surface locations (Sawada et al., 2017). A rotatable inlet, connected to the conical horn, was rotated after the first landing operation to change the chamber for sample storage.

On August 26, 2019, the sample catcher, inside which all chambers were closed, was transported into the sample container inside the Earth reentry capsule and sealed. The container sealing method adopted for Hayabusa2 is an aluminum metal seal, where the sample catcher is

sealed in the sample container by deformation of the curved surface lid with the edge of the sample container (Okazaki et al., 2017).

1.3 Reentry capsule retrieval operation

Hayabusa2 delivered the reentry capsule to Earth on Dec. 6, 2020. The landing area of the capsule was determined by receiving a beacon signal transmitted from the capsule using five antennas installed at different locations along the reentry path. The Marine radar systems and two Drones were also used for the location of the capsule, the heat shields, and the parachute.

The reentry capsule was located nearby the parachute, which was found from helicopter observation. A safety check of the capsule was first completed at the landing location because pyrotechnic devices were used for the parachute deployment and separation. No damage to the capsule was observed, and the capsule was transported back to the Quick Look Facility (QLF) in the Woomera Range Complex with permission from the Range Safety Officer.

The sample container was carefully taken out of the reentry capsule at the QLF. The temperature monitor attached to the sample container indicated that the container was never heated over 65°C, which is lower than the maximum daytime temperature at the Ryugu surface. The container was cleaned in the clean booth at the QLF and was installed onto the Hayabusa2 GAs Extraction and Analysis system (GAEA). After overnight evacuation of the vacuum line of GAEA, on Dec. 7 the bottom of the sample was pierced with a tungsten carbide needle to release sample volatile components held inside the sample container. The container was in vacuum, indicating the container seal held during reentry and therefore little to no terrestrial contamination had occurred. The gas extracted from the sample container was split into four gas tanks at room temperature, and the residual gas in the system was then trapped into two gas tanks cooled at liquid nitrogen temperature. A fraction of the gas was analyzed by a quadrupole mass spectrometer. The sample container was put into a nitrogen-purged anti-vibration transportation box and was safely transported to ISAS/JAXA on Dec. 8, 2020 (~57 hours after the capsule landing).

1.4 ISAS Curation facility for the Hayabusa2 samples

The policy of the sample curation is that all the materials (gases, dust, rock) returned from Ryugu are stored, handled, and allocated to maximize the scientific information extracted during sample analysis. Under this policy, the Hayabusa2 curation facility in the JAXA Extraterrestrial Sample Curation Center (ESCuC) aims at producing a sample catalogue with basic sample information (e.g., size, shape, weight, optical images and NIR spectroscopic data) to enable allocation of the most appropriate materials without degrading the sample characteristics. The Hayabusa2 curation system, situated in a Class-1000 cleanroom at ESCuC, consists of five chambers: 1) CC3-1 for opening the returned container in vacuum, 2) CC3-2 for vacuum handling of samples, 3) CC3-3 for changing the handling environment from vacuum to purified nitrogen gas, 4) CC4-1 for retrieving the samples in the container, and 5) CC4-2 for picking and observations in a purified nitrogen gas environment. The CC-4-2 is equipped with an optical microscope and an FTIR spectrometer. An infrared hyperspectral microscope (MicrOmega provided by CNES) is attached at CC3-3.

1.5 Sample container opening operation and initial sample description

The Hayabusa2 sample container remained sealed with the metal-to-metal sealing system. The container lid was pressed against the container edge with a pressure load of ~2700 N through pressure springs. To open the container in the clean chamber designed to receive the Hayabusa2 samples in vacuum, the container was installed into the container opening system. The pressure springs and the outer lid with latches were then taken apart from the container while keeping the pressure load constant. The container with the opening system was attached to the clean chamber (CC) 3-1, designed to maintain the Hayabusa2 returned samples in vacuum, on Dec. 11.

After the CC3-1 was evacuated to reach a high vacuum ($<10^{-5}$ Pa), the container was opened on Dec. 14 inside the CC3-1 under a static vacuum condition while monitoring the chamber atmosphere with a quadrupole mass spectrometer. The chamber was re-evacuated after the container opening, and the sample catcher, where samples are supposed to be stored, was taken out of the container using the opening system. Black powdery materials were observed at the bottom of the container. These are most likely to be residual particles from the sampler catcher.

The extracted sample catcher was rotated in the CC3-1 to place chamber A in the up-position and transferred to CC3-2, which was also kept under vacuum. The CC3-2 was isolated by closing a gate valve between the CC3-1 and CC3-2. The chamber A cover was cleaned with a Teflon spatula. Screw bolts of the cover were removed with a hex key rotation system, and the cover was taken apart with an electrostatic chuck system. Two particles inside chamber A (a few mm in size) were picked up from those samples with a sample picking tool in vacuum and put into a quartz glass dish for further storage under vacuum in CC3-2. After picking a couple of particles, chamber A was covered with a quartz glass to transport to CC3-3.

After the transfer of the catcher to CC3-3, the CC3-3 chamber was isolated by a gate valve and purged slowly with purified nitrogen. Further handling of the sample catcher and samples was performed in pure nitrogen gas using Viton-coated butyl gloves.

The catcher was then transferred to CC4-2 through CC4-1 to measure the weight with a microbalance. Based on the design weight of the catcher and a tare weight of an attached jig, the total weight of samples inside the catcher is determined to be ~ 5.4 g. The catcher was then transferred back to CC4-1, where the catcher was dismantled to recover samples from chambers A, B, and C. Particles in chamber C included cm-sized pebbles as well as a metallic particle. Particles smaller than 1 mm were also observed in chamber B. The samples in each chamber were separated into sapphire glass dishes.

The samples in each dish were weighed and photographed, followed by non-destructive spectroscopic observation in the visible to near-infrared wavelength range. A MicrOmega spectroscopic imager, which is identical to that onboard the MASCOT lander, was also used for spectroscopic observation in the near-infrared wavelength range. The optical observation with ONC-T filters was also carried out to obtain multi-band images of the bulk samples. After the initial description of the samples in the dishes, individual pebbles and particles were picked up from the bulk samples with a vacuum tweezer for further description.

1.6 Particles in the sample container

The initial description of the samples inside the sample container by the ISAS/JAXA curation team found that the samples have the following characteristics: (1) Particles were found in two separate chambers used for the two landing operations at Ryugu, indicating that the samples at the different surface locations were obtained successfully; (2) The particles were black in color, consistent with the color of Ryugu boulders (Sugita et al., 2019); (3) Millimeter- to centimeter-sized pebbles are present. One centimeter-sized grain, close to the maximum obtainable size (Sawada et al., 2017), was found in the sample obtained during the second landing operation nearby the artificial crater. (4) The total weight of the sample exceeds 5 g, which is far more than the mission requirement of 0.1 g (Tachibana et al., 2014). All the sample characteristics suggest that the Hayabusa2 sampler system worked efficiently and effectively to collect representative surface samples of Ryugu.

There were a few metallic materials, which are most likely to be pure aluminum metal that was used for the sampler system. Because the sample container and the sample catcher are made of aluminum alloy, the incorporation of pure aluminum metal from the sampler system is distinct and will not have a large impact on the returned samples.

1.7 Analytical results of Ryugu samples

Analysis of Ryugu particle by the curation team and the initial analysis team has shown that the returned sample well represents the surface of Ryugu from spectroscopic and morphological points of view (Yada et al., 2021; Pilorget et al., 2021; Tachibana et al., 2022) and that Ryugu, belonging to one of the most common asteroid groups, is a parent body of CI chondrites that are the least fractionated from the Sun's elemental abundance but the rarest group of carbonaceous chondrites (e.g., Yokoyama et al., 2022; Nakamura et al., 2022). It has also been found that CI chondrites on the Earth suffered alteration in the Earth's surface environment since their fall, and Ryugu sample is recognized as the freshest (terrestrial weathering-free) CI-type material.

Details of the analytical results can be found in the following papers:

Yada T. et al. (2021) *Nature Astronomy* DOI: 10.1038/s41550-021-01550-6

Pilorget C. et al. (2021) *Nature Astronomy* DOI: 10.1038/s41550-021-01549-z

Tachibana S. et al. (2022) *Science* DOI: 10.1126/science.abj8624

Yokoyama T., Nagashima K. et al. (2022) *Science* DOI: 10.1126/science.abn7850

The latest reference list of analytical results is available [here](#) and through [the AO website](#).

2. Samples available for the 3rd AO and database

2.1 Amount and type of samples

Fifteen mass percent of the returned sample (about 0.75 g out of 5 g) will be available for the first several AOs, which will be open twice a year. This was recommended by the Hayabusa2 sample allocation committee (HSAC) to the ISAS curation steering committee for final approval. The first AO distributed 74 particles (229.5 mg in total) to 40 proposal teams out of 57 submitted proposals. The second AO distributed 53 particles and 10 aggregate samples (217.0 mg in total) to 38 proposal teams out of 47 submitted proposals.

In this third AO, four types of samples will be available: (1) about 22 particles that are individually described in a non-destructive way inside the clean chamber will be available. The typical size of the particles is 1-2 millimeters. The particles have not been exposed to the air after their recovery from the sample container. This category of samples is the same as those available for the first and second AO. (2) About 15 sets of aggregate samples (5-10 mg each). These samples have been described as aggregates and no information of individual particles is available. (3) Gas samples collected from the sample container using the GAEA gas extraction and collection system (Miura et al., 2022, *Earth Planet. Space* DOI: 10.1186/s40623-022-01638-x). The more information on gas sample distribution will be included in the sample database. (4) Samples returned from the initial analysis team. They include polished sections, particle fragments, FIB sections and so on.

The available samples are marked in the database (<https://darts.isas.jaxa.jp/curation/hayabusa2/>) with detailed information. In this 3rd AO, the maximum number of samples allocated to each proposal is currently planned to be up to five. This number does not include the number of previously-allocated samples and may change when the available sample list is released.

2.2 Duration of sample loan

Allocated samples will be available for a period of one year following the arrival of the sample(s). Extension of this period could be possible but only with approval by the ISAS curation steering committee.

2.3 Ryugu sample database

The Ryugu Database System (DBS) provides a list of Ryugu samples available for research to aid researchers to request samples through the AO.

The Ryugu DBS is run using open-source technologies, such as PHP, PostgreSQL, and Apache, and data servers on Data ARchives and Transmission System (DARTS) at ISAS/JAXA. The Ryugu DBS provides information on each individual grain (typically larger than 1 mm along the longest dimension) and on aggregate samples. Aggregate samples consist of fine grains (mostly smaller than 1 mm) put in a single dish and are documented in bulk.

The basic information listed in the DBS includes photomicrographs, weight, size, and spectroscopic data, all of which are obtained in the clean chamber system without exposure to air as described in Section 1.5. The spectroscopic data can be downloaded with CSV format. Along with basic information, the analysis history and data obtained in previous analysis cycles can also be found for each sample. The data obtained by the project-led initial analysis and that from curation work outside JAXA will also be archived in the future.

When a sample is divided into multiple pieces, each piece will have a sub-number after the original number, so that users can easily find the relation among different samples in the list.

The web interface of Ryugu DBS has three different view modes: Table style, Thumbnail style, and Detailed list style. Users can select the view mode depending on their purposes. The DBS also has a search function.

3. Proposal Preparation and Organization

3.1 Notice of Intent (NOI) to propose

Proposers will submit a NOI by the specified time. All proposals must be preceded by the NOI. The material in an NOI is confidential and will be used for preparing for the review process.

The following information is requested for the NOI:

- A title of the anticipated proposal
- A brief description of the anticipated proposal and its objective(s) (up to 150 words)
- The names of (potential) co-investigators. Note that when a student requests the sample, his/her supervisor must be included as a co-investigator.

3.2 Proposal style format

Proposals shall be written in English and be submitted in PDF format. The minimum font size of the main text shall be 11 point and the text shall be single-spaced. Text within figures and tables may use a smaller font as long as it is legible.

The proposal's main body must not exceed 12 pages (including figures) when formatted on A4 paper. Only information in the first 12 pages of the proposal's main body will be considered for evaluation. Template will be available at the AO website (<https://jaxa-ryugu-sample-ao.net>).

3.3 Required proposal elements

The following elements shall be provided online to the AO website. They will be included in a cover of the proposal.

- Title of proposal
- Name of proposer
- Proposer's affiliation and e-mail address
- Co-investigators (their names, affiliations, and e-mail addresses)
- Abstract (up to 250 words)
- Keywords that characterize the proposed work
- ID number of requested samples (up to 10 samples with priority ranking)

- Minimum number (or weight) of samples to complete the proposed work

The main body of the proposal shall consist of:

- 1) **Scientific background and goals.** This section should include science question(s) and why Ryugu sample investigation is best suited to answer these questions. This section should also explain why the specified samples (and/or amount) are required.
- 2) **Research plan.** This section should also include the analytical capabilities and the roles of co-investigators.
- 3) **Sample History.** This includes sample preparation, as well as post-analysis alteration, the amount of samples to be returned, and their forms.
- 4) **References.** A Reference list that relates to the proposed work and techniques should be included within the main body.

3.4 Letter of support from research organizations

Proposals must be submitted with support letters from research organizations where PIs and collaborators belong to. The support letters should be in PDF formats.

4. Proposal Submission

4.1 Submission of NOI at the AO website

An NOI shall be submitted from the AO website with the required elements listed in Section 3.1. After the NOI submission, an email from the AO system will be promptly sent to the proposer indicating the receipt of NOI. The AO administrative office will check the submission within three working days, and an email will be sent to the main proposer and listed collaborators when the NOI is accepted. The main proposer will receive another email to provide a passcode for a registered user to log into the AO system to submit a proposal. The registered user can change the passcode at any time through the AO website.

4.2 Submitting proposals through the AO website

The proposal must be submitted through the AO website. A proposer is required to provide the elements in Section 3.3 using the web form. The main part of the proposal should be uploaded as a pdf file, and the file size must be less than 50 Mb. The information and the pdf file can be saved in the AO web server. The information on the required elements is editable and the pdf file is replaceable prior to final submission before the submission deadline.

4.3 Proposal receipt

A proposer will receive an email from the AO system shortly after submission indicating that a proposal was successfully submitted. If a proposer does not receive the email, please contact the AO administrative office.

4.4 Renewal of submitted proposal

The proposer may renew a submitted proposal at any time before the submission deadline. After the final submission deadline, the proposer must contact the AO administrative office for a renewal.

4.5 Withdraw of submitted proposal

The proposer may withdraw a proposal at any time for any reason. The proposer may send a request to withdraw a proposal to the AO administrative contact listed in the AO website.

5. Proposal Review and Selection

5.1 Administrative review

Proposals will be first reviewed if they meet minimum administrative requirements. The requirements include (but are not limited to):

- Proposal is submitted by the due
- Proposer is eligible to submit a proposal
- Proposal meets the editorial requirement (Section 3.2)
- Proposal is submitted with support letters from research organizations

Proposals that do not meet the minimum administrative requirements could be returned to proposers without further evaluation.

5.2 Peer evaluation

Each proposal is expected to be reviewed by at least three reviewers who are invited from the community. Proposals will be scored on a 5-point scale for scientific merit and technical feasibility with comments on relevance, strength/weakness, feasibility and so on.

5.3 Panel review

After peer evaluation of each proposal, the AO review committee will convene to discuss the proposals and make a recommendation list of proposals to be selected and samples to be allocated.

The AO review committee may consist of ~10 scientists with a wide range of expertise (chemistry, mineralogy, petrology, volatiles, and organics) in the field of cosmochemistry. A panel member is allowed to be a collaborator of a proposal, but he/she will not join the discussion on the proposal involved or the final vote. The AO review committee members will also provide peer evaluation of submitted proposals (Section 5.2).

The panel discussion will be made with encouragement to early career scientists and promotion of gender equality in an equitable and fair manner to reduce the impact of unconscious bias. Proposals from researchers in developing countries are also strongly encouraged.

5.4 Selection

The AO panel will submit the recommendation list to HSAC for final approval. If HSAC requests reconsideration of the recommendation, the AO panel will resume their discussion on proposal selection.

Selected proposers will be informed from the AO administrator soon after the final approval. Names of selected proposers and research titles will be listed in the AO website.

6. Award Notification

After the recommendation from the AO review committee is approved by the HSAC, the ASRG will issue award notices to the proposers. It is scheduled to occur no later than early July 2023.

7. Sample and Data Management

7.1 Responsibility

Selected proposers (investigators hereafter) should be received allocated samples within 6 months after the award notification. Investigators are responsible for the security of the samples allocated and will be held personally accountable in the event of sample loss. Investigators shall make every effort to avoid unnecessary contamination of the samples and must return the sample, except for that consumed and/or destroyed during analysis, immediately upon completion of the approved investigation.

Investigators are also responsible for arranging customs formalities for the sample transfer from ISAS to their institutions and from their institutes back to ISAS when required.

7.2 Sample identification management

If the sample is divided into multiple pieces or fractions, derivative samples shall have sub-numbers that will be used for future reports in journals and in the Ryugu DBS. Investigators are requested to report to the AO administrator when the sample is divided into pieces.

7.3 Data management

Investigators must report the results of their analysis to ISAS/JAXA in a timely manner. Investigators are strongly encouraged to present reports on their work at the Hayabusa symposium, having being held annually since 2013, during or after the sample loan. Some travel expenses may be supported by ISAS upon request. The data obtained from the allocated sample(s) shall be archived and listed in the Ryugu DBS no later than one year from the end of the sample loan. Data format and date of data release can be discussed between the investigator and the AO administrator.

7.4 Return of samples to ISAS

Allocated samples should be returned to ISAS (nominally) one year after their delivery. Samples can be transported through commercial carriers (e.g., FedEx). Expense for the sample transfer to ISAS should be covered by the investigators.

Terms and conditions for the Announcement of Opportunity for Hayabusa2 sample investigation

January, 2022

This agreement is made between the Japan Aerospace Exploration Agency (hereinafter referred to as "JAXA"), established under the provisions of the Japan Aerospace Exploration Agency Law, represented by its President and having its principal office at 7-44-1 Higashimachi, Jindaiji, Choufu-shi, Tokyo, Japan, and the Research Organization (hereinafter referred to as the "Research Organization") that submitted the application form for this agreement to JAXA, hereinafter collectively referred to as "the parties."

Recognizing that JAXA shall provide a sample of the asteroid Ryugu brought back by Hayabusa2, recognizing that JAXA issued the Announcement of Opportunity (hereinafter referred to as "AO"), the Research Organization submitted a proposal in response to the AO, and recognizing that JAXA has selected that proposal, the parties hereto agree to the Terms and Conditions as follows.

1. Definitions

As used in this agreement, the following terms shall have the meanings indicated. "Hayabusa2" includes the asteroid explorer plus all of the instruments on board. "Hayabusa2 sample" means the particles of the asteroid Ryugu brought back to Earth by the Hayabusa2 return capsule.

A "PI" is the person who has been selected to perform the AO activities and who belongs to the Research Organization, and whose name is shown on the Work Plan as being responsible for the research. A "Co-investigator" (Co-I) is a person named in the proposal who supports the PI in performing the research defined in this agreement with approval by the Research Organization and JAXA.

"Research" is defined in the AO and further detail is provided in the Work Plan. "Research Results" means the results derived from the implementation of the work plan submitted to the AO.

2. Purpose and Scope

The purpose of this agreement is to establish the terms and conditions under which the Research Organization shall conduct the AO activities. The Research is described in the Work Plan.

3. Period of Performance

This agreement shall come into force upon issuance of a confirmation sheet prescribed by JAXA and shall continue in effect during the sample loan period, unless terminated as described in Article 22. Notwithstanding the foregoing, Articles 9, 10, 11, 12, 18, 19, 20, 21, 25, and 26 shall remain in effect after the expiration of the loan period.

4. Affiliation

1. If the Research Organization wishes to add Co-Is to the Research Plan after the proposal selection, the Research Organization shall first obtain the consent of JAXA for such personnel. The Research Organization shall submit to JAXA a list of such candidate Co-Is in order to obtain

JAXA's consent. If JAXA does not agree to the proposed list of candidate Co-Is, then JAXA will send notification to the Research Organization within seven (7) days of receiving the list of candidate Co-Is.

2. The Research Organization shall supervise the PIs and Co-Is engaging in the Research Projects and shall ensure that all PIs and/or Co-Is engage in the Research Projects in accordance with the terms and conditions of this agreement. For avoidance of doubt, with regard to this agreement, the PIs and Co-Is shall not be deemed a third party.

3. If a PI dies, retires from the Research Organization, takes a leave of absence from work, or is no longer engaged in the Research Projects, the Research Organization shall immediately notify JAXA. JAXA and the Research Organization may either terminate this agreement, or, the Research Organization may designate a researcher who belongs to the Research Plan as PI.

4. If the Research Organization appoints a new PI, the researchers can continue AO activities following notification to JAXA. If JAXA does not agree to the proposed new PI, then JAXA will notify the Research Organization within fourteen (14) days of receiving the notification proposing the new PI.

5. JAXA's Responsibilities

JAXA will make reasonable efforts to:

- a) Prepare a list of Hayabusa2 samples and make it available on the website, and,
- b) Allocate the Hayabusa2 sample to the PI that the PI requested. If multiple requests are made for individual samples, JAXA will take all reasonable efforts to provide a sample that closely matches the original request.

6. Research Organization's Responsibilities

The Research Organization will make reasonable efforts to:

- a) Develop a work plan for the AO activity providing for the Hayabusa2 sample to be returned to JAXA soon after the AO activity is completed,
- b) Conduct and complete AO activities in accordance with the work plan,
- c) Establish an adequate security system for the Hayabusa2 sample,
- d) Deliver the Research Results as a summary by the end of the performance period as described in Article 3, and
- e) Account for the condition of the Hayabusa2 samples prior to returning them to JAXA.

7. Rights and Obligations Related to Hayabusa2 Samples

- a) The PI shall not use the Hayabusa2 sample for any other purposes than those defined by the work plan.
- b) The PI shall keep the sample as unpolluted as possible.

8. Transportation of Hayabusa Samples

- a) JAXA will use commercial transportation for delivery of the Hayabusa2 sample to the Research Organization and will accept scientific risks such as X-ray inspection, opening of the container in the airport, and its loss.
- b) If required, the PI is entitled to propose a delivery method to JAXA.

9. Transfer of Technical Data

Except as otherwise provided in this Article, each party under this agreement shall transfer all technical data considered necessary to fulfil the Research Plan, to the extent feasible.

The parties will undertake to handle expeditiously any request for technical data presented by the other party for the purpose of this agreement. Neither party shall have any right to require the

other party to transfer any data if such transfer would violate the laws or regulations of the country having jurisdiction over such transfer.

The furnishing party shall mark with a notice, or otherwise clearly indicate, any technical data that are to be protected as proprietary or for export control purposes. Such a notice shall indicate any specific conditions regarding how such technical data may be disclosed or used by the receiving party including, for export control (a) that such technical data shall be used or disclosed only for fulfilling the receiving party's responsibilities under this agreement, and, for proprietary rights; (b) that such technical data shall not be disclosed, duplicated, or used by persons or entities other than the receiving party, or for any other purpose, without the prior consent of the furnishing party.

Each party shall observe any clearly indicated limitation on the handling of transferred technical data.

According to the directives of the furnishing party, the receiving party shall return or otherwise dispose of technical data provided under the Agreement upon completion of the activities specified under the Agreement.

10. Intellectual Property Rights

If the Research Organization solely generates Potential Intellectual Property Rights in the course of the Research Projects (Solely-Owned Intellectual Property Rights), the party shall notify the other party immediately. In this case, the Research Organization may take steps to apply for registration of the resulting Intellectual Property Rights as solely-owned ones at its own expense, provided that it shall obtain prior confirmation of the other party. For the avoidance of doubt, only if Potential Intellectual Property Rights are generated or created by the Research Organization's sole work and sole funding shall such Potential Intellectual Property Rights be deemed to be solely generated or created by the Research Organization.

11. Usage of Research Results

The Research Organization solely owns the Research Results and may utilize them exclusively. However, if JAXA wishes to utilize the Research Results, JAXA shall obtain written permission from the Research Organization in advance.

12. Publication of Research Results

1. The results obtained through the performance of these AO activities by the Research Organization will be made available to the general public in a timely manner. If the Research Organization intends to publish the Research Results, the Research Organization should inform JAXA prior to submission.
2. The Research Organization shall add a statement to the publication that indicates as appropriate that the Research Results have been obtained through the cooperation between the Research Organization and JAXA.

13. Language

All communications between the Research Organization and JAXA under this agreement shall be in English.

14. Force Majeure

Neither party is liable for failure, delay, or suspension in performing its part of this agreement when such failure is due to reasons including, but not limited to, fire, war, inevitable accident, act/policy of government, and legal restrictions beyond the control of either party.

15. Taxes and Customs

If any customs fees and/or taxes of any kind are levied on the transactions necessary for the

implementation of this agreement, such customs fees and/or taxes shall be borne by the party of the country levying the fees and/or taxes.

16. Funding

There will be no exchange of funds under this agreement. Each party shall bear the costs necessary to fulfill its own responsibilities under this agreement.

17. Limitations on Liabilities

JAXA and the Research Organization each agree to waive any claim against the other with respect to any injury or death of its employees or the employees of its related entities, or with respect to damage of any kind, or any loss of its own property or property of its related entities arising out of activities under this agreement (hereinafter referred to as "Damages"), excepting such Damages which arise through willful misconduct and gross negligence and excepting intellectual property rights.

18. Privacy Policy

JAXA will not use personal information including name, affiliation, and email address other than for implementing this AO. JAXA also may provide this information to JAXA's contractor supporting this AO. In that case, JAXA will ensure that the contractor will adhere to the same privacy policy.

19. Inventions and Patents

Nothing in this agreement shall be construed as granting or implying any right to, or interest in, patents owned by or inventions that are independently developed by the parties to the agreement or their contractors or subcontractors.

20. Confidentiality

1. In this agreement, "Confidential Information" means any information that a party discloses or presents in writing or by other media to the other party in the course of these Research Projects. However, Confidential Information does not include the following:

- a) Information that is already known to the public when disclosed by the disclosing party;
- b) Information that becomes known to the public after disclosure by the disclosing party without intentional misconduct or negligence of the receiving party;
- c) Information that the receiving party already had before the disclosure by the disclosing party;
- d) Information that the receiving party acquires from a duly authorized third party not subject to confidentiality obligations;
- e) Information that the receiving party independently develops without utilizing information obtained from the disclosing party;
- f) Information with prior written consent of the disclosing party for disclosure and publication; or
- g) Information that is required to be disclosed by applicable laws, judgment, or order of a competent court. In this case, the receiving party shall promptly notify the disclosing party of the necessity of disclosure.

2. The receiving party shall keep Confidential Information secret, and shall not disclose or divulge any Confidential Information to a third party without the prior written consent of the disclosing party.

3. The confidentiality obligation under this Article shall remain effective for a period of five (5) years after the termination of the Agreement. However, this period of keeping confidentiality may be extended or shortened by mutual agreement.

21. Government Approvals

Each party shall obtain such permits, licenses, and other government authorizations as required for it to perform its responsibilities under this agreement, and shall comply with all applicable laws and regulations.

22. Suspension

If the Research Organization fails to meet the purposes of this agreement or to comply with the terms of this agreement, JAXA may suspend execution of this agreement, in whole or in part, pending corrective action by the Research Organization or a decision by JAXA to revoke this agreement.

23. Termination

1. Either party may terminate the Agreement
 - a) When the other party commits a dishonest and/or inequitable act that irreparably harms the mutual trust between the Parties, provided that the breaching party fails to offer any effective and satisfactory remedial measures within seven (7) days after receiving a demand for corrective action from the harmed party;
 - c) When the other party violates any of the terms and conditions of this Agreement, provided that the breaching party fails to offer any effective and/or satisfactory remedial measures within seven (7) days after receiving a demand for corrective action from the harmed party; and,
 - d) When both Parties consent to termination.
2. Upon termination of the Agreement, the Research Organization shall promptly return the samples to JAXA, and, deliver to JAXA all work including, but not limited to, all work in progress and all work that is completed and otherwise ready for delivery.
3. The preceding paragraph shall apply to termination upon the occurrence of the events contemplated in Article 4, Paragraph 3.

24. Special Agreement

Any supplement, modification, or amendment of this Agreement shall only be binding if made under a mutual written agreement between the Parties which makes specific reference to this Agreement.

25. Dispute Resolution

The Parties agree to make their best efforts to solve amicably any dispute, controversy, or difference arising out of, in connection with, or resulting from this Agreement.

26. Arbitration

All disputes that cannot be amicably settled by the method defined in the previous paragraph hereof will be settled by arbitration in Tokyo in accordance with the Commercial Arbitration Rules of the Japan Commercial Arbitration Association.

STATEMENT OF AGREEMENT

I, the undersigned, have read and fully understood the above “Terms and conditions for the International Announcement of Opportunity for Hayabusa2 Sample Investigation” and agree to abide by the rules contained therein.
